The 2 Pounder Anti-Aircraft Gun

In 1937 it was decided to adopt the Naval 2 Pounder Anti-Aircraft gun for land use, this was at the same time as when the Bofors was also adapted. It soon became clear that the Bofors was a far more effective weapon and so only very few were used, these were used positioned near ports and naval installations. When production of Bofors reached sufficient numbers these guns were replaced and sent to the navy for ship use.

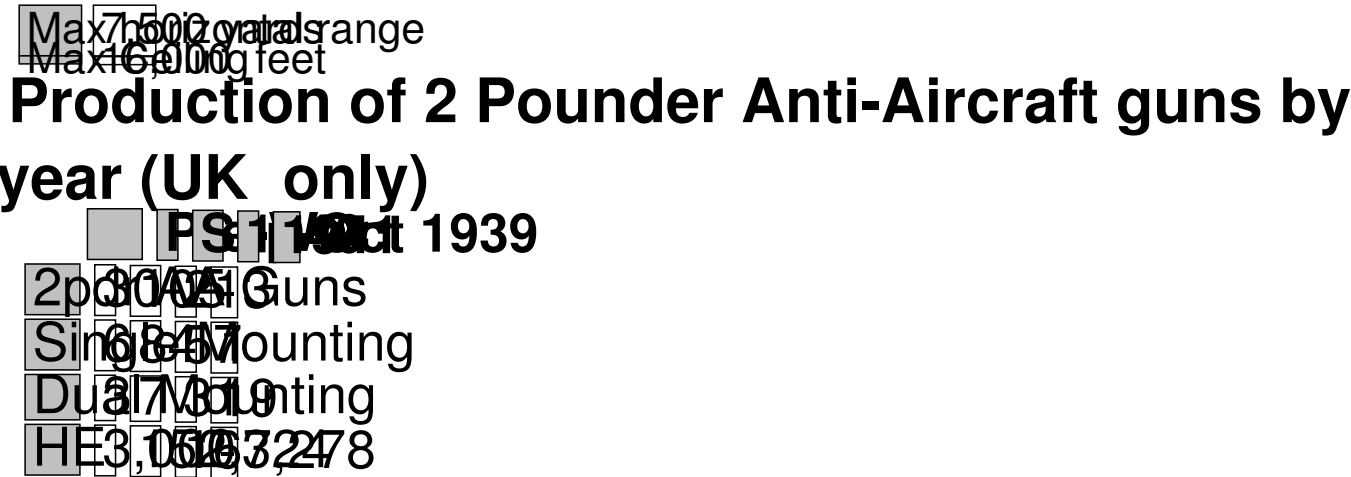

Ground weapons came in both single and dual mountings, naval versions also had quad and eight gun mounting.
